

How to change the detection levels using the existing side-mounted flange.

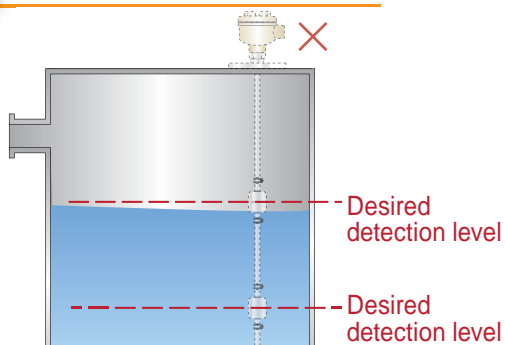

No more extra work on the tank!

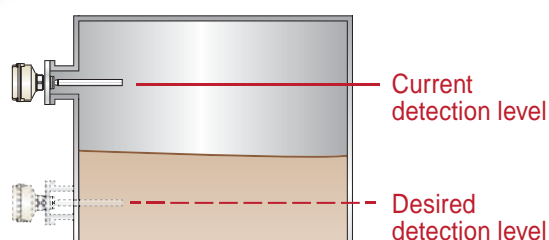

You think you will need additional tank work in the following cases?

CASE 1 Vertical float level switch KF-300

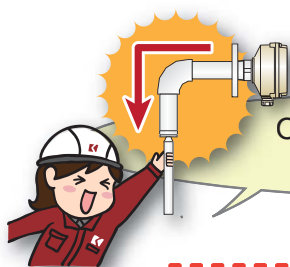

We want to detect multiple levels but vertical mounting is not possible.

CASE 2 Capacitance level switch or Vibration level switch

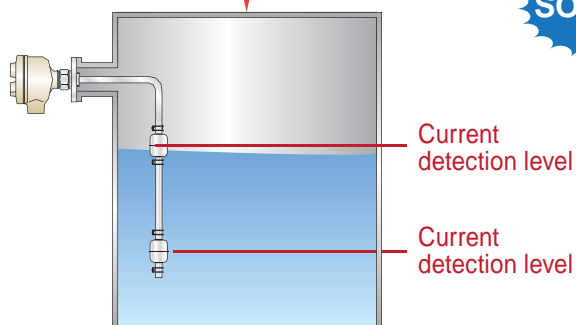

Horizontal mounting is fine but the mounting location is too high.

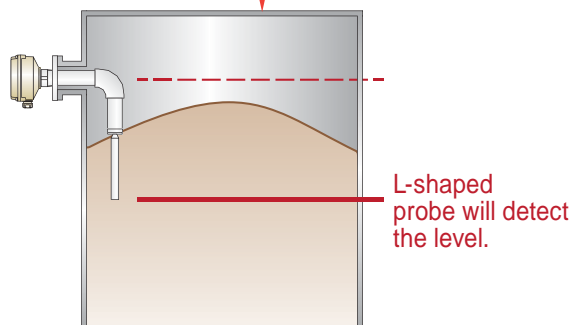

Our L-shaped probe will solve the problem without any additional work on the tank!

SOLVED!

Install the L-shaped probe on the side of the tank, and you can detect multiple levels!

You can detect the lower level than the mounting location!

More of L-shaped probes are available. The length or other specs will be customized to suit your application.
