

Inlay prevent the ingress and buildup of materials !

Inlay version

When you are measuring powder by a level sensor, sometimes the powder builds up in the gap between the sensor and tank nozzle.

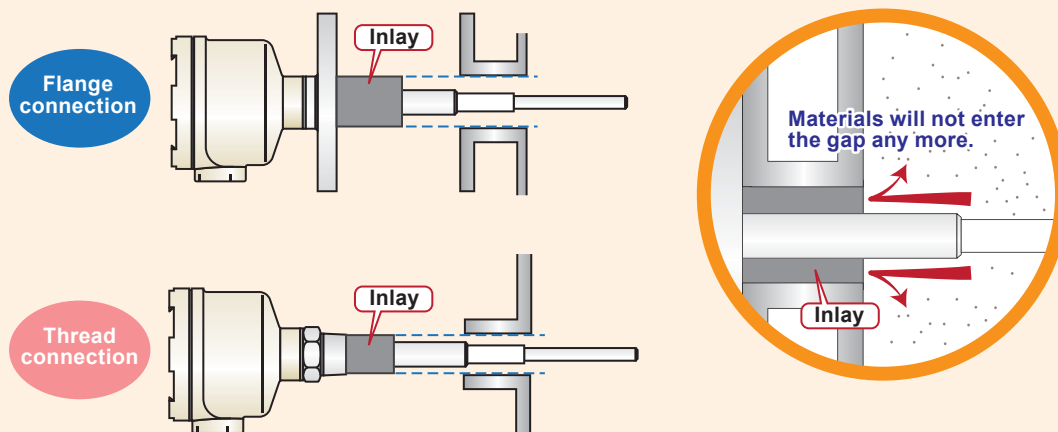

Inlay version is recommended for the application where hygiene is critical such as food companies when old materials and new materials should be mixed.

What is Inlay ?

Inlay is a part to fill the gap between the level sensor and nozzle.

- When the size of the particle is big, the inlay prevents the particle to enter the gap and remain there.
- Inlay is available in metal (Stainless steel, iron) or resin (TEFLON, POM) and we manufacture it as per your request.
